MATHEMATICS / POPULAR SCIENCE

Writing equations for space, evaluating them in time.

In 1924, the Polish logician Jan Łukasiewicz proved that algebraic parentheses are an artifact of sixteenth-century printing rather than a law of mathematics. When an expression is evaluated from its innermost core outward across four visible registers, parentheses vanish, hidden memory states disappear, and multi-stage derivations advance one step at a time.

From John Napier's logarithm tables and the 1535 Milanese contest over the cubic equation to Carl Friedrich Gauss's recovery of Ceres by Least Squares, Charles Proteus Steinmetz's alternating-current phasors, and William Hewlett's 1972 pocket-calculator specification, fundamental methods of mathematics and engineering share a common postfix structure on the four-register stack of the **StackCalc SC-32**.

Logarithms & Power Laws • Vectors, Phasors & Solid Geometry • Cardano's Cubic & Brent's Root Solver • Romberg Quadrature & Least Squares • 36-Bit Binary, Time Value of Money & 100 Canonical STEM Equations.
